## Description

The present invention relates to compounds having antiviral activity, processes for their preparation and pharmaceutical compositions containing them.

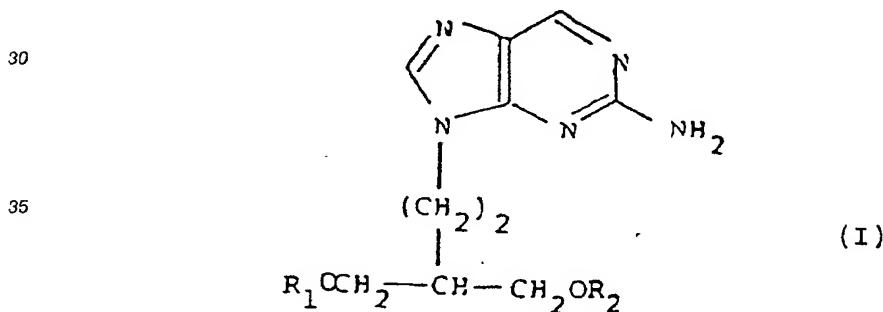

5 EP-A-108285 (The Wellcome Foundation Limited) discloses purine derivatives having antiviral activity. The compound 9-(4-hydroxy-3-hydroxymethylbut-1-yl) guanine of formula (A)

is disclosed in Synthetic Communications, 2(6), 345-351 (1972) but no pharmaceutical activity has been indicated for the compound in this document. We have subsequently shown that the compound of formula (A) does have pharmaceutical activity, and this is disclosed in EP-A-141927 (Beecham Group p.l.c.).

25 We have now prepared a series of analogues of the compound of formula (A) which has useful oral absorption properties and is converted *in vivo* to the compound of formula (A) which has anti-viral activity.

According to the present invention there is provided a compound of formula (I)

or a salt thereof, wherein R<sub>1</sub> and R<sub>2</sub> are each independently hydrogen, acyl or phosphate, provided that when one of R<sub>1</sub> or R<sub>2</sub> is phosphate, the other is hydrogen; or R<sub>1</sub> and R<sub>2</sub> are joined together to form a cyclic acetal group, a cyclic carbonate group or a cyclic phosphate group.

45 Acyl groups for R<sub>1</sub> and R<sub>2</sub> are those where the group R<sub>1</sub>O- or R<sub>2</sub>O- is a pharmaceutically acceptable carboxylic ester group which are

where R<sub>3</sub> is C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, or optionally substituted aryl.

55 As used herein the term 'aryl' includes phenyl which may be optionally substituted with one or two groups selected from C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy or halo such as fluoro or chloro.

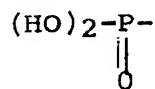

Preferably R<sub>3</sub> is methyl, ethyl, propyl, methoxy, or phenyl.

Suitably when R<sub>1</sub> and R<sub>2</sub> are joined together, they

$\text{>C} = \text{O}$ ,  $\text{>P(O)OH}$  or  $\text{>C(C}_1\text{-3 alkyl)}_2$

15 In the case of compounds of formula (I) wherein one of  $R_1$  or  $R_2$  is an acyl or phosphate group, the compound exists in two enantiomeric forms. The invention includes both enantiomers in isolated form and mixtures thereof.

The compounds of the invention may be in crystalline form or as hydrates and it is intended that both forms are encompassed by the expression 'compound of formula (I)' used herein.

50

55

5

10

15 and subsequently, if necessary, converting the compound of formula (I) thus formed to the free base or to a different salt thereof.

40 The intermediate compound of formula (III) may be prepared by treating a compound of formula (IV)

50

55

The reaction may be carried out in an inert organic solvent, preferably dimethylformamide, in the presence of an inorganic base, preferably potassium carbonate.

The compound of formula (IV) may itself be prepared by brominating a compound of formula (VI)

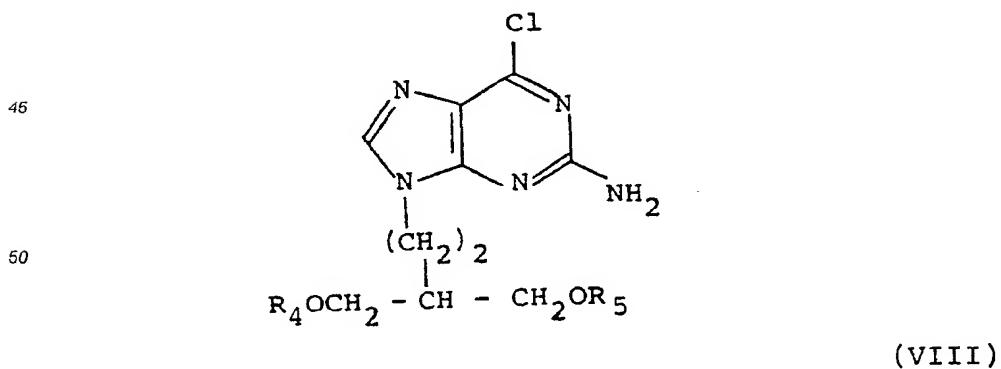

The reaction is preferably carried out by treating the compound of formula (VI) with carbon tetrabromide and triphenylphosphine in an organic, aprotic solvent such as dimethylformamide.

40 Compounds of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> are acyl groups or are joined together to form a cyclic carbonate group can be prepared by reduction of a compound of formula (VIII)

55 wherein R<sub>4</sub> and R<sub>5</sub> are the same or different acyl groups, or R<sub>4</sub> and R<sub>5</sub> are joined together to form a cyclic carbonate group.

Suitable acyl groups for  $R_4$  and  $R_5$  include groups

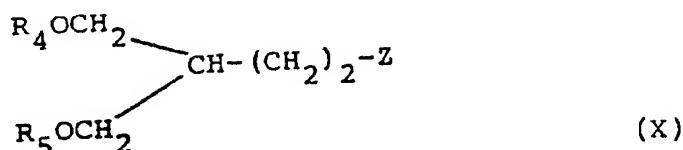

as hereinbefore defined.

10 The reduction is suitably carried out under conditions described above for the reduction of a compound of formula (III).

Compounds of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> are acyl groups can be converted to a compound of formula (I) wherein R<sub>1</sub> and or R<sub>2</sub> are hydrogen by conventional deacylation or partial deacylation processes. For example, reaction with methanolic ammonia can be used to effect complete deacylation to yield compound of formula (I) wherein both R<sub>1</sub> and R<sub>2</sub> are hydrogen. Reaction with a mild base such as potassium carbonate can result in partial deacylation to produce a compound of formula (I) wherein one of R<sub>1</sub> or R<sub>2</sub> is hydrogen and the other is an acyl group.

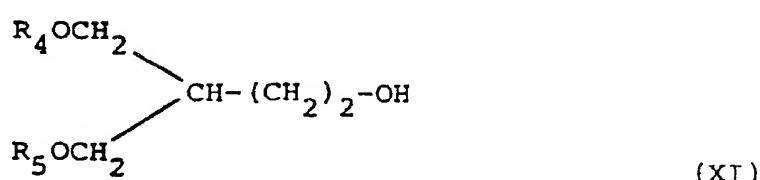

Compounds of formula (VIII), may be prepared by treating the compound of formula (V) as hereinbefore defined, with a compound of formula (X)

<sup>30</sup> in which R<sub>4</sub> and R<sub>5</sub> are as defined in formula (VIII) and Z is a leaving group such as Cl, Br, or I, preferably Br.

The compound of formula (V) is a known compound.

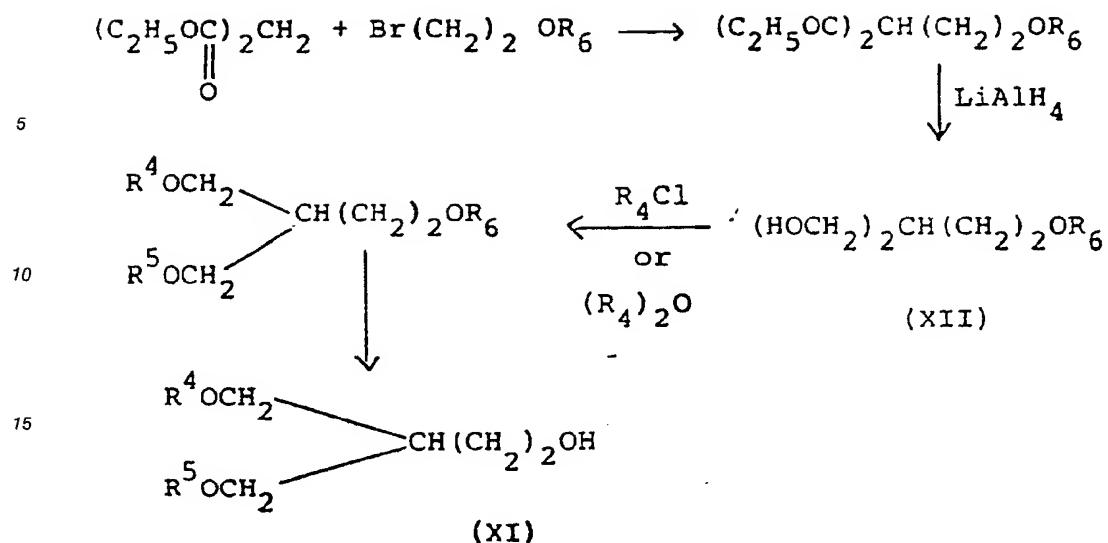

Compounds of formula (X) in which Z is bromine may be prepared by brominating a compound of formula (XI).

45 preferably by treatment with carbon tetrabromide and triphenylphosphine in an organic, aprotic solvent, such as dimethylformamide.

Compounds of formula (X) in which Z is Cl or I may be prepared in an analogous manner.

Compounds of formula (XI) in which R<sub>4</sub> and R<sub>5</sub> are the same and are acyl groups may be prepared according to the following schematic process:

wherein R<sup>6</sup> is a removable protecting group.

Suitably R<sup>6</sup> is a group removable by hydrolysis or hydrogenolysis.

Preferably R<sup>6</sup> is a group removable by hydrogenolysis such as benzyl. This group can be removed by conventional methods for example by using hydrogen in the presence of a palladium/carbon catalyst.

Compounds of formula (XI) wherein R<sub>4</sub> and R<sub>5</sub> are joined together to form a cyclic carbonate group may be prepared by reaction of a compound formula (XII)

30

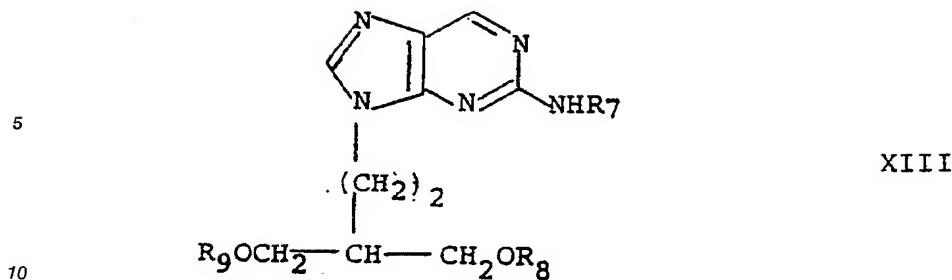

wherein R<sup>6</sup> is a hereinbefore defined with phosgene or 1,1' - carbonyldiimidazole, and thereafter if desired removing the protecting group R<sup>6</sup>. The reaction is suitably carried out in a dry organic solvent such as pyridine at a temperature of from 0° - 50° C, conveniently at ambient temperature.

The above described processes for preparing the compound of formula (III) and compounds of formula (VIII) are also disclosed in Published European European Patent Application No. 0141 927.

Compounds of formula (I) wherein R<sub>1</sub> and/or R<sub>2</sub> is acyl may be prepared by esterifying a compound of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> is hydrogen by conventional methods. If necessary during the esterification process the -NH<sub>2</sub> group and optionally also one of the -OR<sub>1</sub>, or -OR<sub>2</sub> groups may be protected by a suitable protecting group such as trityl or monomethoxytrityl. The product is subsequently deprotected for example by treatment with acid such as acetic acid. For example, compounds of formula (I) wherein R<sub>1</sub>O- and/or R<sub>2</sub>O- is a carboxylic ester group may be prepared by reaction of a compound of formula (I) which has been optionally protected as described above with (a), an appropriate carboxylic acid chloride or (b) an appropriate carboxylic acid anhydride or (c) an appropriate carboxylic acid in the presence of a dehydrating agent such as dicyclohexylcarbodiimide (DCCI).

Compounds of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> form a cyclic carbonate group can be prepared by reaction of a compound of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> are hydrogen and the NH<sub>2</sub> group is optionally protected; with phosgene or 1,1-carbonyldiimidazole, and thereafter if necessary deprotecting the product. Suitable protecting groups for the NH<sub>2</sub> group include trityl and monomethoxytrityl as described above. The reaction is suitably carried out in a dry organic solvent such as pyridine at a temperature of from 0° - 50° C, conveniently at ambient temperature.

Compounds of formula (I) wherein one of R<sub>1</sub> or R<sub>2</sub> is phosphate or R<sub>1</sub> and R<sub>2</sub> together form a cyclic phosphate can be prepared by treating a compound formula (XIII)

15 wherein R<sub>7</sub> is a protecting group and R<sub>8</sub> and R<sub>9</sub> are hydrogen or a protecting group provided that one of R<sub>8</sub> or R<sub>9</sub> is hydrogen; with a phosphorylating agent and thereafter if desired deprotecting resultant product. When R<sub>8</sub> and R<sub>9</sub> are both hydrogen, a cyclic phosphate compound is produced. Suitable protecting groups for R<sub>7</sub> and R<sub>8</sub> or R<sub>9</sub> are trityl or monomethoxytrityl. Deprotection of the resultant product can then be effected by treatment with acid such as acetic acid.

20 A suitable phosphorylating agent is phosphorus oxychloride, optionally in the presence of a base such as pyridine.

25 In addition, when one of R<sub>8</sub> or R<sub>9</sub> is a protecting group cyanoethyl phosphoric acid can be employed as a phosphorylating agent in order to produce a compound of formula (I) wherein one of R<sub>1</sub> or R<sub>2</sub> is phosphate.

30 The reaction product after treatment with cyanoethyl phosphoric acid is treated with aqueous ammonia, which yields the ammonium salt of the phosphate ester as the final product.

35 Compounds of formula (XIII) can be prepared by protection of a compound of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> is hydrogen, for example by reaction with a trityl or monomethoxytrityl halide such as monomethoxytrityl chloride.

40 Alternatively compounds of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> are joined together to form a cyclic phosphate can be prepared from a compound of formula (I) wherein one of R<sub>1</sub> or R<sub>2</sub> is phosphate and the other is hydrogen by cyclisation of the monophosphate for example using dicyclohexylcarbodiimide.

45 Compounds of formula (I) wherein one of R<sub>1</sub> or R<sub>2</sub> is acyl and the other is hydrogen or R<sub>1</sub> and R<sub>2</sub> together form a cyclic acetal can be prepared by reacting a compound of formula (I) wherein R<sub>1</sub> and R<sub>2</sub> are hydrogen with a compound of formula (XIV)

35

40

wherein

R<sub>10</sub> is C<sub>1-6</sub> alkyl,

R<sub>11</sub> is C<sub>1-6</sub> alkyl,

m is 0,1 or 2, and

n is an integer of 2, 3 or 4

provided that m + n is equal to 4,

and thereafter, if n is 3 or 4, hydrolysing the product.

50 When a compound of formula (I) in which R<sub>1</sub> and R<sub>2</sub> is a cyclic acetal is required, a compound of formula (XIV) wherein m is 2 and n is 2 is employed. For example, when m is 2, n is 2 and R<sub>10</sub> is methyl, the product is the compound of formula (II) as hereinbefore defined. The reaction is suitably carried out in an inert organic solvent such as tetrahydrofuran or N,N-dimethylformamide, in the presence of an acid such as p-toluenesulphonic acid.

55 Where necessary the subsequent hydrolysis step is an aqueous hydrolysis preferably carried out in the presence of an acid such as p-toluenesulphonic acid.

The composition may also be in the form of an ingestible capsule, for example of gelatin, to contain the compound, or in the form of a syrup, a solution or a 10 suspension. Suitable liquid pharmaceutical carriers include ethyl alcohol, glycerine, saline and water to which flavouring or colouring agents may be added to form syrups. The compounds may also be presented with a sterile liquid carrier for injection.

The composition may also be formulated for topical application to the skin or eyes.

BIOLOGICAL DATAXanthine Oxidase Catalysed Oxidation of 2-Amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl)purine

5 To an aqueous solution of 2-amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl)purine (0.5mM, 0.7ml; pH7) was added bovine milk xanthine oxidase (20µl, 0.4 unit). Dissolved atmosphere oxygen was allowed to act as electron acceptor and changes in the UV spectrum were measured. After 4 minutes 25% conversion had occurred and after 2.5 hours conversion was essentially complete. The oxidation product was identified as  
10 9-(4-hydroxy-3-hydroxymethylbut-1-yl)guanine by its UV spectrum and HPLC retention time.  
(Incubation of 9-(4-hydroxy-3-hydroxymethylbut-1-yl)guanine with xanthine oxidase under identical conditions resulted in no change over a 2 hour period.)

15 Oral Absorption of 2-Amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl) purine and 2-Amino-9-(4-acetoxy-3-acetoxyethylbut-1-yl)purine and their Conversion to 9-(4-hydroxy-3-hydroxymethylbut-1-yl) guanine in Mice

20 Procedure

25 2-Amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl)purine, 2-amino-9-(4-acetoxy-3-acetoxyethylbut-1-yl)-purine and 9-(4-hydroxy-3-hydroxymethylbut-1-yl)guanine were administered by oral gavage (0.2mmoles/kg in 0.1ml of 1% carboxymethyl cellulose) to 20g female Balb/C mice which had been starved for 18 hours.  
30 Fifteen 60 and 180 minutes later, blood was collected from three mice per time point by cardiac puncture using heparinised syringes. Equal aliquots at each time were pooled and an equal volume of 16% trichloroacetic acid added. Following centrifugation (8,500g) to remove precipitated proteins, 0.5ml of supernatant was immediately added to 0.1ml of saturated sodium bicarbonate solution and the resulting mixture analysed by high performance liquid chromatography or stored at -20°C prior to analysis.
